

Bike Sharing Network Performance Dashboard –Summary

Overview

This dashboard provides a comprehensive overview of the bike-sharing network by tracking station availability, bike utilization, operational status, banking services, and geographical distribution. The month filter enables users to analyze seasonal performance and compare operational trends across cities.

Key Findings

- The network consists of 1,000 stations and 20,000 bikes with an average utilization rate of 44%, indicating moderate overall usage.
- Approximately 93% of stations are operational while only 7% are closed, reflecting strong service reliability.
- Bruxelles-Capital, Lyon, and Toulouse maintain the highest bike availability, whereas smaller cities have comparatively lower inventory.
- Cities such as Vilnius record the highest utilization rates, suggesting effective demand, while several cities have opportunities to improve bike usage.
- Only about 12% of stations provide banking services, highlighting potential for expanding customer payment options.
- The replenishment table identifies stations with low bike availability, enabling timely redistribution and minimizing service disruptions.
- The geographical map shows a wide distribution of stations across Europe, with higher concentrations in major urban areas.

Recommendations

Regularly rebalance bikes between stations based on demand, improve utilization through promotional campaigns and demand forecasting, expand banking-enabled stations to enhance customer convenience, and continuously monitor replenishment alerts and monthly trends to optimize fleet allocation and operational efficiency.

Conclusion

Overall, the dashboard indicates a well-performing bike-sharing network with high operational availability. By improving utilization in lower-performing cities, expanding customer services, and maintaining proactive bike redistribution, the organization can enhance customer satisfaction, maximize asset utilization, and support sustainable urban mobility.
